

A UNIQUE PEST CONTROL CHEMISTRY FOR HIGHER QUALITY YIELDS

Beleaf insecticide offers a new unique mode of action, different than any other pome fruit insecticide on the market. Beleaf provides consistent performance on aphids in apple crops. The unique anti-feeding action of Beleaf provides superior aphid control.

Active Ingredient:

The active ingredient in Beleaf is flonicamid, the only insecticide registered on fruit and vegetables in the 9C classification group. Beleaf is not a neonicotinoid.

Pome Fruit Crops:

Apple, pears, crabapple, loquat, mayhaw, and quince.

Rate/Timing:

0.12-0.16 kg/ha, use higher rates for greater populations and/or dense foliage. UAP recommends using the higher rate to obtain longer residual protection. Apply before aphids reach economic thresholds or as populations increase but before damaging numbers become established.

Water Volume:

Apply in sufficient water to ensure good coverage, use a minimum of 50 gallons per acre applied by ground.

Re-Entry Interval:

Do not enter or allow worker entry for the purpose of performing thinning activities in the treated area during the REI of 2 days.

Pre-Harvest Interval:

21 days pre-harvest interval for all pome fruit.

Pack size:

Beleaf is packed in a 6 X 0.68 kg case.

Features and Benefits:

- Stops aphids from piercing/feeding in 30 minutes. The pest is unable to penetrate the leaf tissue. Beleaf has irrecoverable anti-feeding mode of action, which results in long extended control
- Active by contact and ingestion
- Both immature and adult stages are controlled
- Mortality may take 2-5 days
Due to dehydration/starvation, do not evaluate treatment until insects desiccate, ~ 3-days
- Residual activity of 2-3 weeks
Dependent on environmental conditions, plant growth, and rate used
- Beleaf has low ecological impact
No groundwater contamination risk
flonicamid is safe on non-target organisms such as beneficials

Beleaf Resulted in an 80% Reduction in Leaf Damage
